

Steam Game Research & Data Collection Tool

Overview

Searching for dozens or even hundreds of games on Steam and manually collecting their information can be time-consuming and repetitive. To solve this problem, I developed a **Steam-inspired game research and data collection tool** connected to the Steam Store.

Instead of manually searching for 50–100 games and recording their details one by one, the tool provides a centralized interface where users can search for games, review their information, create a shortlist, calculate the estimated total price, and export the collected data as a CSV file.

Problem

When researching a large number of games, manually collecting data from the Steam Store requires repeatedly:

- Searching for each game
- Opening individual game pages
- Checking ratings and review counts
- Recording prices
- Keeping track of selected games
- Calculating the total cost
- Organizing the collected information into a dataset

For a small number of games this is manageable, but for 50–100+ games it becomes repetitive and inefficient.

My Solution

I built a web-based tool that simplifies this workflow.

The application allows users to search for games and immediately view relevant information in a structured card-based interface.

For example, a search for "**Cyber**" can return games such as Cyberpunk 2077, Cyberpunk 2077: Phantom Liberty, Cyber Knights: Flashpoint, Digimon Story Cyber Sleuth: Complete Edition, and other matching results.

Each game can be reviewed and added to a personal shortlist.

Key Features

Game Search

Users can search for games using keywords instead of manually browsing through the Steam Store.

Game Information

The results display useful information such as:

- Game title
- Cover image
- Steam rating
- Number of reviews
- Current price
- Discount information

★ Shortlist

Users can select games they are interested in and maintain a separate shortlist.

Total Price Calculation

The application automatically calculates the estimated total price of the selected games.

CSV Export

The collected shortlist can be exported to a **CSV file**, making it easier to continue working with the data in Excel, Google Sheets, Python, or other data-analysis tools.

⚡ Research Workflow

The main goal is to turn a repetitive manual process into a faster and more organized workflow.

Example Workflow

Search → Review Results → Select Games → Build Shortlist → Calculate Total → Export CSV

This makes the tool particularly useful when researching a large number of games or building a dataset from Steam game information.

Project Goal

The long-term goal is to turn this into a more complete **Steam Game Research & Dataset Builder**, with features such as advanced filtering, sorting, genre/category filters, price ranges, ratings, pagination, and richer dataset exports.

The idea is simple: instead of spending hours collecting game information manually, let the tool organize the research for you.

Output:
